Power Magnetism @ High Frequency Workshop Adds Summer Edition

The AMPED consortium and UPITT's Swanson School of Engineering will host a PSMA-sponsored [Power Magnetism at High Frequency satellite workshop](#) on Tuesday, August 18 at the Energy innovation Center in Pittsburgh, PA. The workshop will build on the established reputation and follows the single-track format of the annual pre-APEC Power Magnetism at High Frequency Workshop.

The theme of the morning session will be advanced magnetic materials and their application. The theme of the afternoon session will be EMI/EMC applications. There will be an opportunity for interactive discussions with experts presenting technology demonstrations and posters from both industry and research organizations. The technology demonstration presentations and posters will be available during the morning and afternoon breaks, the lunch session and the networking hour at the end of the workshop.

The full agenda is available [here](#).

Attendees of the satellite workshop will receive complementary access to the annual AMPED industry workshop in the same venue and on August 19, the day following the satellite event. Registration is recommended as soon as possible, as complimentary access is limited and subject to availability.

A unique aspect of the workshop developed by the PSMA Magnetism Committee is the combination of technical presentations, hands-on demonstrations, and poster sessions. These sessions allow participants to explore new measurement techniques, simulation tools, materials, and design approaches while engaging directly with experts developing the next generation of magnetism technologies.

For more information or to register, see the eventbrite [page](#).
